

Reflection

What did I learn?

Honestly I learned way more doing this than I would have from just reading about classes. I always heard the word "inheritance" in class but it didn't really make sense until I wrote Homework and Exam and made them extend Assignment with `super()`. Once I saw that I didn't have to rewrite `record_score` or `__str__` again in the subclasses, it just clicked - that's literally the point of inheritance, not repeating yourself. I also learned the hard way that indentation in Python is not just for looking neat, it actually decides what belongs to what. I messed this up so many times tonight, like putting a method inside another method by accident without even noticing. And I learned a lot of Git stuff I didn't know before, like `git remote -v` to check which repo you're actually connected to, and that cloning something doesn't mean it's yours to push to - I had to make my own repo and repoint everything to it.

Challenges I faced

The worst one was this bug where my test code just would not run. No error, nothing, it would just go straight back to the prompt like the file was empty. I spent almost an hour on it - checking if I had two different Pythons installed, checking if the file even saved, searching the file directly for the text `"__main__"` and it genuinely wasn't finding it even though I could see it on the screen. In the end I just deleted that whole test block since it wasn't actually required for the assignment, it was only there so I could check my classes worked. That was honestly a relief because I was really tired and stressed about the deadline at that point. Another thing that kept happening was mixing up which file I was even in, or VS Code opening a random loose file instead of my actual project folder, so I'd type code and wonder why nothing was working, only to realize it wasn't even saved inside my repo folder. Lots of small dumb mistakes like typing `commit-m` instead of `commit -m` too.

How would I improve it, given more time?

If I had more time I'd add a way to edit or delete an assignment after adding it, right now you can only add and view, you can't fix a mistake without restarting the whole program. I'd also want it to actually save to a file so my data doesn't disappear every time I close the program, since right now everything's gone the second you hit exit. I'd also go back and add more comments explaining what each function does, especially in `models.py` and `tracker.py`, since I ran out of time to do that properly for every single one. And next time I'd probably test smaller pieces of code as I go instead of writing a big chunk and only finding out something's broken at the end.
